g 1600 Make sure that the temperature of the dough is 26-28°C.
g 2000 Let rise for 12-14 hours at 22-24°C with the 70-80% of relative humidity. If the proofer room is devoid of humidifier, cover the dough with a plastic cloth.
The dough shall quadruple its initial volume.

ADVICE:

- We suggest to cut out a 250g piece of dough and to put it into a 1L jug to check the pace of the leavening and verify the quadruplication of the volume.
- We suggest to begin to knead at second speed and then, when at $\frac{3}{4}$ of the kneading time, change to first speed and bring the kneading to end.
- If the temperature of the first dough is above 28°C, it will be necessary to decrease the leavening time.
- If you are using a planetary mixer with a "dough hook" attachment or a spiral mixer you will have to reduce the amount of water specified in the first dogh (we suggest you to use 2400/2250 gr)

Divide the dough into portions of the required size (1kg colomba requires two portion of 450gr each) and roll each portion up into into a ball shape. Move onto boards or trays and leave to rest at 28-30°C for another 20 minutes.

Roll them up tight again and transfer into the specific paper moulds.

Put in the proofer room at 28-30°C with relative humidity of about 70% until the top of the dough nearly leans out of the edge of the mould; if the proofer room is devoid of humidifier, cover the dough with plastic sheets.

Cover the top of the colomba with glaze and decorate with almonds and pearl sugar. Lastly dust it with confectioners' sugar.
